

HQExoTM **Exosome-Jurkat E6-1**

Catalog: Exo-IC03

PRODUCT INFORMATION

HQExo™ Exosome-Jurkat E6-1
Exo-IC03
Exosome derived from human T lymphocyte cell line (Jurkat E6-1)
Exosomes are small membrane-extracellular vesicles (30-160 nm in diameter) produced from multivesicular b
odies and play a crucial role in intercellular signaling and communication. Exosomes from immune cells can r
gulate immune responses of recipient cellswhich becomes a great promise in cancer immunotherapy because of
f their immunogenicity and molecular transfer function. The cargoes carried on exosomes have been identified
which contains miRNA and mRNA molecules, peptides, proteins, cytokines and lipids. Exosomes derived fro
m tumor cells and immune cells are directly influence the phenotype and immune-regulation functions of targ
ted cells. HQExo TM exosomes derived from immune-related cell lines could use as positive controls for exoso
me isolation and functional research, such as ELISA, FACS, WB. With the huge potential for cancer immuno
herapy, exosome become the most effective cancer vaccines. Based on its molecular transfer function, high bi
compatibility and low cytotoxicity to normal tissue, exosomes become a promising carrier for therapeutic mol
cular delivery system for anti-cancer treatment. Exosome can be purified from the cell culture by ultracentrifu
ation or precipitation techniques, and characterized by nanoparticles tracking analysis (NTA) and ELISA or V
B. Frozen liquid should be kept at -20°C to -80°C for a long-term stability. Creative Biostructure standard exc
ome products guarantee higher purity and quality to meet our customer's downstream analyses.
Frozen liquid
>1x10^6 particles
Store at -20°C or colder. Recommend to avoid repeated freeze-and-thaw cycles.
